Experiment 15: Mobile Application for Ad Hoc Wireless Networks Using Figma

Aim: To develop a mobile application wireframe in Figma that addresses challenges in ad hoc wireless networks, such as unstable connections, routing problems, limited battery power, and network performance monitoring.

Procedure:

1. Open Figma and create a new design file.
2. Create mobile frames for the AdHocConnect application.
3. Design a welcome screen and login screen.
4. Create a dashboard showing network status and connected nodes.
5. Design a network topology screen to display devices and their connections.
6. Add routing and optimization controls to improve communication between devices.
7. Create node details, network analytics, and security settings screens.
8. Connect the screens using prototype interactions and save the design.

Output:

Result: A mobile application wireframe for managing ad hoc wireless networks was designed using Figma.
